# **OVERVIEW OF COST ALLOCATION**

## **7.1 Cost Allocation Study Requirements**

### **7.1.1 Introduction**

The OEB outlined its cost allocation policies in its reports of November 28, 2007 Application of Cost Allocation for Electricity Distributors, and March 31, 2011 Review of Electricity Distribution Cost Allocation Policy (EB-2010-0219). These are referred to here as the “Cost Allocation Reports”.

In this Application, NPEI has used the 2020 version 3.7 of the Cost Allocation Model released by the OEB on August 1, 2019 to conduct a 2021 Test Year Cost Allocation study consistent with the OEB’s cost allocation policies. The model has been loaded with 2021 Test Year Costs, customer numbers and demand values for NPEI. The 2021 demand values were determined based on the description provided under the Load Profiles section of this Exhibit. The various weighting factors used in the 2021 study have also been explained below.

### **7.1.2 Load Profiles**

In a letter dated June 12, 2015, the OEB requested “distributors to be mindful of material changes to load profiles and propose updates, as appropriate, in cost of service rate applications”. NPEI proposes to use the same method as was used in the 2015 Cost of Service application to determine the demand data for the 2021 cost allocation model. This method involves applying a scaling factor to the 2004 weather normalized volumes supporting the 2004 load profiles to determine an estimate of the 2021 weather normalized load profiles. Then the same method applied by Hydro One to the 2004 load profiles to determine the demand data for the original cost allocation study, is applied to the 2021 load profiles to determine the 2021 demand data. NPEI has provided an Excel

1 spreadsheet named "Load profile model 2004 Hydro One data for 2021" to show how  
2 the 2021 demand data is determined.

3

4 NPEI is the result of the amalgamation of the former Niagara Falls Hydro Inc. and the  
5 former Peninsula West Utilities Ltd. The former Peninsula West Utilities Ltd. filed a Cost  
6 Allocation Informational Filing on March 15, 2007 (EB-2005-0405) (EB-2007-0002). The  
7 former Niagara Falls Hydro Inc. prepared its load profiles for all rates classes and  
8 received RUN1 data from Hydro One for its hourly load shapes, however NFH did not  
9 file a Cost Allocation Informational Filing in 2007 as they were preparing the merger  
10 application and considered it to be more useful, prudent and practical to file a Cost of  
11 Service Study at the time of rebasing and harmonizing rates for the new merged  
12 company. NPEI filed a Cost Allocation Study with the 2011 Cost of Service rate  
13 application. The 2011 Cost Allocation Study was based on information from the  
14 amalgamated companies. NPEI also filed a Cost Allocation Study with the 2015 Cost of  
15 Service rate application.

16

17 NPEI attempted to update the actual hourly data by rate class for the 2018 year. NPEI  
18 had significant differences in the GS<50 kW and GS > 50 kW rate classes when  
19 compared to the actual kWh billed. This was due to many customers having  
20 conventional meters in both of these rate classes. NPEI replaced these conventional  
21 meters with either a MIST meter or smart meter throughout 2016, 2017, 2018, 2019 and  
22 have replaced 23 in 2020. As a result, NPEI will be prepared for the next cost of service  
23 application. NPEI will put in place a process to prepare a load profile for the 2020 year.  
24 This will provide more than one year of data to review the load profiles for the next cost  
25 of service application.

26

27

28

29

30

1 **7.1.3 Cost Allocation Inputs**

2 In the March 31, 2011 Cost Allocation Report, the OEB stated that “default weighting  
3 factors should now be utilized only in exceptional circumstances”. Distributors are  
4 expected to develop their own weighting factors as part of their cost allocation study.  
5 NPEI has developed its own weighting factors as outlined below.

6

7 **Services (Account 1855)**

8

9 To determine the weighting factor to be used for each customer class, the cost of  
10 installing a typical service for each customer class was determined. A weighting factor  
11 was determined by assigning the Residential customer class a factor of 1, as required,  
12 and determining the relative weights of the rest of the classes. The results are  
13 presented in Table 7.1.3-1 below:

14

15

**Table 7.1.3-1-Weighting Factors-Services**

16

	2021 Test Year	2015 Board Approved
Residential	1.0	1.0
GS<50 kW	2.5	2.5
GS>50 kW	9.0	9.0
Streetlight	0.0	0.0
Sentinel Light	0.0	0.0
Unmetered Scattered Load	0.0	0.0

17

18

19 GS < 50 kW – Factor set at 2.5. A work order for a new service for a small commercial  
20 customer usually has more parties including third parties involved, additional approvals,  
21 and additional time spent as these services are usually more complex than a residential  
22 customer.

23 GS > 50 kW – Factor set at 9.0. A work order for a new service for a large commercial  
24 customer is more complex, involves more resources, requires additional approvals and  
25 additional time spent.

1 **Billing and Collecting**

2

3 Comparing a residential bill as a base of 1, NPEI reviewed the time spent in billing and  
4 customer service and collections on customers in each rate class. NPEI has found that  
5 with TOU billing now in place, there are no major differences in rate class billing costs  
6 between the residential rate class and the GS<50 kW rate class. There are additional  
7 steps in billing when billing GS>50 kW customers with respect to interval read analytics,  
8 global adjustment etc. In terms of collection costs, there are a lower number of  
9 customers in this class to collect on however, due to the higher dollar values associated  
10 with these customers these customers are first priority in monitoring outstanding  
11 balances. Also, with GS > 50 kW customers, there is usually more parties involved in  
12 the follow up process for collections, notices, and payment arrangements thereby taking  
13 more time to collect than a residential customer. In 2017, NPEI received its first Class A  
14 customers, where determination of eligibility, education, and on-going customer  
15 engagement with many customers in the GS > 50 kW rate class occurred. NPEI reviews  
16 on a quarterly basis the load for GS<50 kW customers and GS >50 kW customers to  
17 ensure they are in the appropriate rate class. This review as well as the actual transfer  
18 of a customer from one rate class to another does not occur with the residential rate  
19 class thereby increasing the factor for the GS <50 kW and GS >50 kW rate class when  
20 compared to the residential rate class.

21

22 NPEI has assigned the following factors;

23 Residential Service - factor set at 1 per Cost Allocation Instruction

24

25 GS< 50 kW – Factor set at 1.5 as there is more time spent when collections are involved  
26 on a per bill basis and these customers are reviewed quarterly for appropriateness of  
27 rate class based on their load. Billing costs are similar to residential customers for those  
28 GS<50 customers on smart meters.

29

30 GS > 50 kW – Factor set at 2.0 as there is more time spent on both billing and collection  
31 on a per bill basis when issues arise. As well these customers are reviewed quarterly for  
32 appropriateness of rate class based on their load. The billing is more complex than the

1 TOU billing for a residential customer and customer engagement meetings are held for  
2 eligible Class A customers.

3

4 Streetlight, unmetered loads and sentinel lights – a factor of 0.8 has been assigned as  
5 these customers have limited collection activity.

6

7

**Table 7.1.3-2-Weighting Factors-Billing and Collecting**

8

	2021 Test Year	2015 Board Approved
Residential	1.0	1.0
GS<50 kW	1.5	1.5
GS>50 kW	2.0	2.0
Streetlight	0.8	0.8
Sentinel Light	0.8	0.8
Unmetered Scattered Load	0.8	0.8

9

10

11 **Metering Capital-Sheet 1.7.3.3**

12

13 NPEI followed a similar approach as in the COS 2015 whereby the various types of  
14 meters installed were identified and the number of meters installed at the end of 2019  
15 were identified from NPEI's customer information system. The cost to install meters has  
16 increased due to the replacement of all 2G technology meters, and the replacement of  
17 conventional meters with either a MIST meter or a new smart meter.

18

19

20

21

22

23

24

1

**Table 7.1.3-3 Metering Capital**

2

	Weighting Factor 2021	Weighting Factor 2015	Weighted average Cost Per Meter 2021	Weighted average Cost Per Meter 2015	\$ Change	% Change
Residential	1.00	1.00	157.44	118.55	38.89	32.80%
GS < 50 kW	1.69	1.74	265.86	206.05	59.81	29.03%
GS > 50 kW	21.63	19.08	3,405.95	2,261.47	1,144.48	50.61%

3

4

5

6

**Meter Reading-Sheet I-7.1.3.4**

8

9 NPEI will have all of the conventional meters replaced with either a smart meter or a  
 10 MIST meter by August 1, 2020. As at March 31, 2020, NPEI had two MIST meters,  
 11 and 30 smart meters remaining to be changed from conventional meters to  
 12 electronically read meters. The conversion of the 600 volt meters requires the  
 13 assistance of an outside electrician. Meter reading costs for smart meters have  
 14 been assigned a weighting factor of one. As shown in Table 7.1.3-4 below, the effort  
 15 and cost for reading other types of meters are compared to the smart meter reading  
 16 costs to determine an appropriate weight.

17

18

**Table 7.1.3-4 – Meter Reading Weights**

19

	Cost Relative To Residential Average Cost 2021 Test Year	Cost Relative To Residential Average Cost 2015 Board Approved	Average Monthly Meter Reading Costs 2021 Test Year	Average Monthly Meter Reading Costs 2015 Board Approved	Allocation Percentage Weighting Factor 2021 Test Year	Allocation Percentage Weighting Factor 2015 Board Approved
Residential	1.00	1.00	\$ 0.52	\$ 0.32	38.13%	45.91%
GS < 50 kW	5.63	3.07	\$ 2.92	\$ 0.99	18.76%	13.17%
GS > 50 kW	72.50	48.05	\$ 37.65	\$ 15.41	43.11%	40.92%

20

1 On average the costs to read the meter for the GS < 50 kW and GS > 50 kW rate  
2 classes have increased as a result of the switch from a conventional meter to a  
3 MIST meter or the conversion from a conventional meter to a smart meter. The  
4 costs related to meter reading NPEI's distribution stations and transformer station  
5 are included in Account 5310 but for purposes of cost allocation, these expenses  
6 have been excluded. The 2021 Test Year includes a total of \$869,478 for total  
7 meter reading expenses however only \$848,898 is allocated to the rate classes on  
8 Sheet I7.2 of the Cost Allocation model.

#### 9 **7.1.4 Embedded Distributor**

10

11 NPEI is not a host distributor for any embedded distributor.

12

#### 13 **7.1.5 Unmetered Loads**

14

15 NPEI communicates with unmetered load customers, including streetlighting  
16 customers, to assist them in understanding the regulatory context in which  
17 distributors operate and how it affects unmetered load customers. This  
18 communication takes place on an on-going basis and is not driven by the rate  
19 application process.

20

21 NPEI has used the "streetlight adjustment factor" to allocate costs to the  
22 Streetlighting rate class as outlined in the OEB's June 12, 2015 letter. The  
23 streetlight revenue to cost ratio range was tightened as well. Table 7.1.5-1 below  
24 outlines the changes from the 2015 Board Approved to the 2021 Test Year.

	2021 Test Year	2015 Board Approved
Streetlight	93	1,299
Sentinel	298	303
Unmetered Scattered Load ("USL")	325	422

**7.1.6 microFIT class**

NPEI is not proposing to include microFIT as a separate class in the cost allocation model in 2021. NPEI understands that the cost allocation model will produce a calculation of unit costs which the OEB may use to update the uniform microFIT rate at a future date.

**7.1.7 New Customer Class**

NPEI is not proposing to include a new customer class in this Application.

**7.1.8 Eliminate a Customer Class**

NPEI is not proposing to eliminate a customer class in this Application.

1 **7.1.9 Standby Rates**

2

3 On April 2, 2015 the OEB issued a Board Policy of Rate Design for Electricity  
4 Residential Customers in which the Board stated that it intends to remove the  
5 standby charge when the new rate policy is implemented for commercial customers.  
6 To date, a new rate policy for commercial customers has not been implemented.  
7 Currently, NPEI does not have a standby rate and NPEI is not proposing a new  
8 standby rate in this Application.

9

10 **7.1.10 Sheet I6.2 Customer Data Worksheet**

11

12 The Bad Debt Data entered is actually for the Historical Years 2016, 2017, and  
13 2018. The cells identifying the historical year are locked and do not allow for input.  
14 In summary, the 2016 Bad Debt total was \$218,352, 2017 Bad Debt total was  
15 \$\$263,168 and 2018 Bad Debt total was \$ 308,528.

## 7.3 Revenue-to-Cost Ratio Overview

The results of a cost allocation study are typically presented in the form of revenue to cost ratios. The ratio is shown by rate classification and is the percentage of distribution revenue collected by rate classification compared to the costs allocated to the classification. The percentage identifies the rate classifications that are being subsidized and those that are over-contributing. A percentage of less than 100% means the rate classification is under-contributing and is being subsidized by other classes of customers. A percentage of greater than 100% indicates the rate classification is over-contributing and is subsidizing other classes of customers.

In the March 31, 2011 Cost Allocation Board Report, the Board established what it considered to be the appropriate ranges of revenue to cost ratios which are summarized in Table 7.3-1 below. The Streetlight class is shown with the targets as established in the OEB's June 12, 2015 letter. In addition, Table 7.3-1 provides the approved revenue to cost ratios from NPEI's 2015 Cost of Service (EB-2014-0096) compared to the proposed ratios and the OEB Min and Max targets.

1

**Table 7.3-1 – Revenue-to-Cost Ratios**

2

	2015 Board Approved Cost Allocation Study	2021 Cost Allocation Study	2021 Proposed Ratios	OEB Target	
				Min	Max
Residential	91.65%	94.24%	94.24%	85%	115%
GS < 50 kW	120.00%	116.96%	116.96%	80%	120%
GS > 50 kW	120.00%	108.82%	110.71%	80%	120%
Sentinel Lighting	119.83%	126.04%	120.00%	80%	120%
Unmetered Scattered Load	91.65%	96.43%	96.43%	80%	120%
Street Lighting	91.65%	217.09%	120.00%	80%	120%

3

4

5

1 **7.3.1 Cost Allocation Results and Analysis**

2 The 2021 Cost Allocation study shows that the Residential, GS < 50 kW, GS > 50 kW,  
 3 and Unmetered Scattered Load rate classes fall within the OEB target range. The  
 4 Sentinel Lighting and Street Lighting rate classes resulted in revenue-to-cost ratios  
 5 above the OEB's Max target. NPEI is proposing to use the Max target revenue-to-cost  
 6 ratio for these two rate classes. As a note, the GS > 50 kW rate class is the balancing  
 7 class.

8

9 Table 7.3-2 below shows the proposed class revenue for this Application. This class  
 10 revenue will be used in Exhibit 8 to design the proposed distribution charges for this  
 11 Application.

12

Appendix 7-2  
OEB RRWF – Sheets 11 and 12 (Cost Allocation)

Ontario Energy Board

# Revenue Requirement Workform (RRWF) for 2020 Filers

## Cost Allocation and Rate Design

This spreadsheet replaces **Appendix 2-P** and provides a summary of the results from the Cost Allocation spreadsheet, and is used in the determination of the class revenue requirement and, hence, ultimately, the determination of rates from customers in all classes to recover the revenue requirement.

Stage in Application Process: *Initial Application*

A) *Allocated Costs*

Name of Customer Class <sup>(3)</sup>	Costs Allocated from Previous Study <sup>(1)</sup>	%	Allocated Class Revenue Requirement <sup>(1)</sup>	%
<i>From Sheet 10. Load Forecast</i>				
(7A)				
1 Residential	\$ 20,940,354	69.18%	\$ 26,201,616	69.24%
2 General Service < 50 kW	\$ 3,203,396	10.58%	\$ 4,058,338	10.72%
3 General Service > 50 kW	\$ 5,604,282	18.52%	\$ 7,261,574	19.19%
4 Unmetered Scattered Load	\$ 109,566	0.36%	\$ 91,375	0.24%
5 Sentinel	\$ 89,264	0.29%	\$ 91,894	0.24%
6 Streetlight	\$ 320,851	1.06%	\$ 135,878	0.36%

<b>Total</b>	<b>\$ 30,267,713</b>	<b>100.00%</b>	<b>\$ 37,840,675</b>	<b>100.00%</b>
<b>Service Revenue Requirement (from Sheet 9)</b>			<b>\$ 37,840,675.30</b>	

- (1) Class Allocated Revenue Requirement, from Sheet O-1, Revenue to Cost || RR, row 40, from the Cost Allocation Study in this application. This excludes costs in deferral and variance accounts. For Embedded Distributors, Account 4750 - Low Voltage (LV) Costs are also excluded.
- (2) Host Distributors - Provide information on any embedded distributor(s) as a separate class, if applicable. If embedded distributors are billed in a General Service class, include the allocated costs and revenues of the embedded distributor(s) in the applicable class, and also complete Appendix 2-Q.
- (3) Customer Classes - If these differ from those in place in the previous cost allocation study, modify the customer classes to match the proposal in the current application as closely as possible.

B) Calculated Class Revenues

Name of Customer Class	Load Forecast (LF) X current approved rates (7B)	LF X current approved rates X (1+d) (7C)	LF X Proposed Rates (7D)	Miscellaneous Revenues (7E)
1 Residential	\$ 20,983,817	\$ 22,531,540	\$ 22,531,540	\$ 2,161,859
2 General Service < 50 kW	\$ 4,114,496	\$ 4,417,972	\$ 4,417,972	\$ 328,862
3 General Service > 50 kW	\$ 6,928,887	\$ 7,439,947	\$ 7,577,389	\$ 461,736
4 Unmetered Scattered Load	\$ 102,299	\$ 109,845	\$ 104,329	\$ 5,321
5 Sentinel	\$ 76,021	\$ 81,628	\$ 81,628	\$ 6,984

15				
16				
17				
18				
19				
20				
<b>Total</b>	<b>\$ 32,474,115</b>	<b>\$ 34,869,338</b>	<b>\$ 34,869,338</b>	<b>\$ 2,971,337</b>

- (4) In columns 7B to 7D, LF means Load Forecast of Annual Billing Quantities (i.e., customers or connections, as applicable X 12 months, and kWh, kW or kVA as applicable. Revenue quantities should be net of the Transformer Ownership Allowance for applicable customer classes. Exclude revenues from rate adders and rate riders.
- (5) Columns 7C and 7D - Column Total should equal the Base Revenue Requirement for each.
- (6) Column 7C - The OEB-issued cost allocation model calculates "1+d" on worksheet O-1, cell C22. "d" is defined as Revenue Deficiency/Revenue at Current Rates.
- (7) Column 7E - If using the OEB-issued cost allocation model, enter Miscellaneous Revenues as it appears on worksheet O-1, row 19,

C) Rebalancing Revenue-to-Cost Ratios

Name of Customer Class	Previously Approved Ratios	Status Quo Ratios	Proposed Ratios	Policy Range
	Most Recent Year: 2015	(7C + 7E) / (7A)	(7D + 7E) / (7A)	
	%	%	%	%
1 Residential	91.65%	94.24%	94.24%	85 - 115
2 General Service < 50 kW	120.00%	116.96%	116.96%	80 - 120
3 General Service > 50 kW	120.00%	108.82%	110.71%	80 - 120
4 Unmetered Scattered Load	119.83%	126.04%	120.00%	80 - 120
5 Sentinel	91.65%	96.43%	96.43%	80 - 120

14				
15				
16				
17				
18				
19				
20				

- (8) Previously Approved Revenue-to-Cost (R/C) Ratios - For most applicants, the most recent year would be the third year (at the latest) of the Price Cap IR period. For example, if the applicant, rebased in 2012 with further adjustments to move within the range over two years, the Most Recent Year would be 2015. However, the ratios in 2015 would be equal to those after the adjustment in 2014.
- (9) Status Quo Ratios - The OEB-issued cost allocation model provides the Status Quo Ratios on Worksheet O-1. The Status Quo means "Before Rebalancing".
- (10) Ratios shown in red are outside of the allowed range. Applies to both Tables C and D.

(D) Proposed Revenue-to-Cost Ratios <sup>(11)</sup>

Name of Customer Class	Proposed Revenue-to-Cost Ratio			Policy Range
	Test Year 2021	Price Cap IR Period 2022 2023		
1 Residential	94.24%	94.24%	94.24%	85 - 115
2 General Service < 50 kW	116.96%	116.96%	116.96%	80 - 120
3 General Service > 50 kW	110.71%	110.71%	110.71%	80 - 120
4 Unmetered Scattered Load	120.00%	120.00%	120.00%	80 - 120
5 Sentinel	96.43%	96.43%	96.43%	80 - 120

(11) The applicant should complete Table D if it is applying for approval of a revenue-to-cost ratio in 2020 that is outside of the OEB's policy range for any customer class. Table D will show that the distributor is likely to enter into the 2021 and 2022 Price Cap IR models, as necessary. For 2021 and 2022, enter the planned revenue-to-cost ratios that will be "Change" or "No Change" in 2019 (in the current Revenue/Cost Ratio Adjustment Workform, Worksheet C1.1 'Decision - Cost Revenue Adjustment, column d), and enter TBD for class(es) that will be entered as 'Rebalance'.

Ontario Energy Board

# Revenue Requirement Workform (RRWF) for 2020 Filers

## New Rate Design Policy For Residential Customers

Please complete the following tables.

### A Data Inputs (from Sheet 10. Load Forecast)

Test Year Billing Determinants for Residential Class	
Customers	51,935
kWh	454,614,210

Proposed Residential Class Specific Revenue Requirement <sup>1</sup>	\$ 22,531,540.39
--	------------------

Residential Base Rates on Current Tariff	
Monthly Fixed Charge (\$)	\$ 33.67
Distribution Volumetric Rate (\$/kWh)	\$ -

### B Current Fixed/Variable Split

	Base Rates	Billing Determinants	Revenue	% of Total Revenue
Fixed	33.67	51,935	\$ 20,983,817.40	100.00%
Variable	0	454,614,210	\$ -	0.00%
<b>TOTAL</b>	-	-	\$ 20,983,817.40	-

### C Calculating Test Year Base Rates

Number of Remaining Rate Design Policy Transition Years <sup>2</sup>	0
--	---

	Test Year Revenue @ Current F/V Split	Test Year Base Rates @ Current F/V Split	Reconciliation - Test Year Base Rates @ Current F/V Split
Fixed	\$ 22,531,540.39	36.15	\$ 22,529,403.00
Variable	\$ -	0	\$ -
<b>TOTAL</b>	\$ 22,531,540.39	-	\$ 22,529,403.00

Fixed				
Variable				
<b>TOTAL</b>	-	\$ -	-	

Checks <sup>3</sup>	
Change in Fixed Rate	
Difference Between Revenues @ Proposed Rates and Class Specific Revenue Requirement	

### Notes:

- The final residential class specific revenue requirement, excluding allocated Miscellaneous Revenues, as shown on Sheet 11. Cost Allocation, should be used (i.e. the revenue requirement after any proposed adjustments to R/C ratios).
- The distributor should enter the number of years remaining before the transition to fully fixed rates is completed. The change in residential rate design is almost complete and distributors should have either 0 or 1 year remaining. If the distributor has fully transitioned to fixed rates put "0" in cell D40. If the distributor has proposed an additional transition year because the change in the residential rate design will result in the fixed charge increasing by more than \$4/year, put "1" in cell D40.
- Change in fixed rate due to rate design policy should be less than \$4. The difference between the proposed class revenue requirement and the revenue at calculated base rates should be minimal (i.e. should be reasonably considered as a rounding error)
